Module Analysis

Process Module CPU Module Memory Modul Cache and Register Module Pipline Module

Project Bottlenec

Future Work

- Realize CPU controller and datapath with five level pipline
- Realize at least one level cache, Havard architecture.
- Realize dynamic memory management.
- Support of some system library functions.
- Debugger utils and Performance Analysis utils support.

Expected Progress

Simulator

Project Review Project Target Review Expected Progress

Project Introduction Module View File View

Module Analysis Process Module CPU Module Memory Module Cache and Register Module Pipline Module

Project Bottleneck

Future Work

- 1-2 weeks ELF parser module, Register heap module, Memory module. (Finished in 1st week)
- 3-4 weeks CPU module. (Finished in 4th week)
- 5-6 weeks Cache module(Finished in 3rd week), Loader module. (Finished in 2nd week)
- 7-8 weeks Debugger module and some latter works.(To be finished in 1-2 week)

More infomation about our project progress, see our svn: http://code.google.com/p/minic/wiki/MINICintroduction?tm=6

Pipline Module

Project Bottlenecl

Future Work

Struct of Process:

```
typedef struct{
  int status; //Process status
  uint32_t entry; //The entry of a program
  PROC_STACK* stack; //Process stack
  PROC_MEM* mem; //Process memory
}PROCESS;
```

Process is a basic module handles a copy of a progrss in the memory.

Module Analysis Process Module CPU Module Memory Modul

Project Bottleneck

Future Work

CPU Module is the most important module, it lays on the top level and handles add the execuation of a progress. Struct of CPU:

```
typedef struct{
  int cpu_id; //CPU id
  int mode; //CPU mode, normal or trap
 REGISTERS* regs; //Register heap
 CACHE *i_cache, *d_cache;
  PIPLINE * pipline; //CPU pipline
 PROCESS* proc; //Process running on CPU now
  CPU_info* cpu_info; //Information of CPU
                      //from starting
}CPU_d:
```

Future Work

Struct of CPU_info:

```
typedef struct{
  int cycles_total;//total cycles of cpu
  int cycles_work;//work cycles of cpu
  int bubbles;//bubbles of pipline
  int rd_mem_times;//times of read memory
  int wr_mem_times;//times of write memory
  int cache_visit;//times of cache visit
  int cache_miss;//times of cache miss
}CPU_info;
```

Module Analysis Process Module CPU Module Memory Module Cache and Register Module

Project Bottleneck

Future Work

Some problems when do the project

- Keeping each module independent is important but difficult.
- System library function handling is yet left to be realized.
- Some instructions are not realized because of lacking manual.
- Instruction execuation module is hard to test and verify, bacause constructing test set is sometimes ambiguous.
- Too many modules leads to high maintenance cost.
- Some potential bugs need to be resolved.

File View

Module Analysis Process Module CPU Module Memory Module Cache and Register Module

Project Bottlenec

Future Work

Future work in next 1-2 weeks:

- Complete Debugger module and high level console.
- Finish verification outline.
- Construct high-level test set(generate by c files) and low-level test set(generate by assembler files).
- Discuss and solve the problem of system library function call.
- A complete program compiled by unicore32-linux-gcc(the given compiler from lab) can be run completely in out simulator.
